How can viruses enter the air conditioning system?

The air conditioning filter, evaporator and air vents are places where microorganisms have ideal conditions to grow (low temperature and darkness)

How can we prevent them from entering the passenger cabin?

> BY CLEANING & DISINFECTING THE ENTIRE AIR CONDITIONING SYSTEM

Clean

- Clean systems inhibit bacterial growth
- Cleaning physically removes dirt, grime and accompanying germs leaving poor conditions for bacterial growth

Disinfect

- To eliminate most germs like bacteria, fungi, algae and to prevent growth of microorganisms and viruses
- Disinfected systems are protected up to 6 months from bacteria re-growth (NEN 6265 test)

Application

- Nebulisation process guarantees contact with all the components of the air conditioning system (including the filter and the evaporator)
- Aircomatic treatments have a cleaning effect on systems and physically remove microorganisms on systems

Benefits

- Reduction of bad smells is immediately noticeable due to inactivity of germs (bacteria and fungi)
- Helps to prevent infections and allergic reactions by cleaning
- Excellent sanitising treatment to avoid future infections

**POWER
A/C
CLEAN**

Forté Power-Clean AC allows cleaning of a vehicle's air conditioning system with a specially formulated treatment, only to be used with a specific Forté applicator, gaining effective results, saving time and money.

Use biocides safely. Always read the label and product information before use.
